Global Challenges for Food and Agriculture

(Crop) Diversity – Where development, environment and agriculture need to meet

Svalbard, 26. Feb. 2009

Alexander Müller

Assistant Director-General

Natural Resources Management and Environment Department Food and Agriculture Organization of the United Nations (FAO)

1. Global Drivers of Change

(Population growth, Urbanization, Consumption patterns, Food Demand)

2. Natural Resource Management (Land, Water, Biodiversity) **and Energy**

3. Climate Change

4. Soil Carbon Sequestration and Payments for Environmental Services

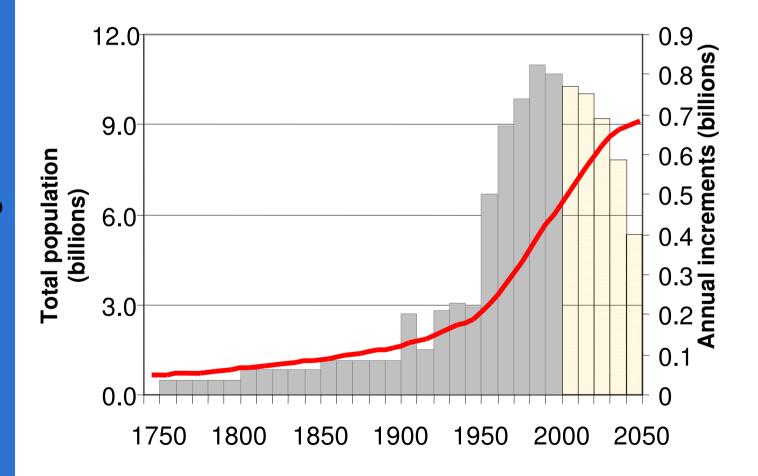

1. GLOBAL DRIVERS OF CHANGE Population growth Urbanisation Food Demand

The main drivers of the long-term outlook

		GDP in low terrain	islands ²⁵					

Global mean annual temperature change relative to 1980-1999 (°C)

Agriculture-related GHG Emissions

Agriculture contributes

- 22 % of total anthropogenic CO₂ emissions
- 51 % of CH_4 emissions
- 78 % of N_2O emissions
- almost 35 40 % of CO₂ equivalent emissions*
- taking into account land use change (important) and fossil fuel use (less important)

4. Soil Carbon Sequestration and Payments for Environmental Services

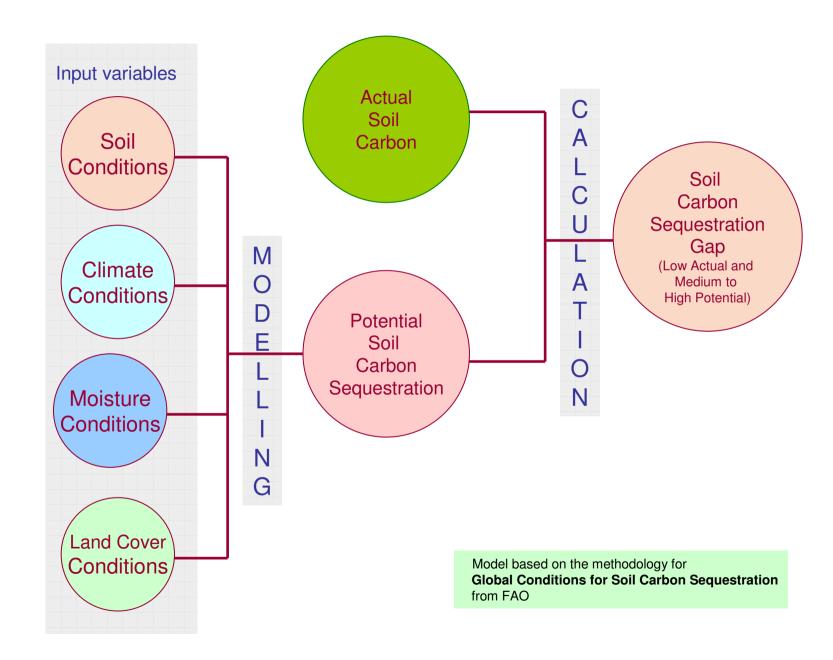

Can we use the new financial mechanisms in UNFCCC (CDM, Emission Trading Schemes)

- 1. to sequester carbon in the soil,
- 2. to improve World Food Security,
- 3. to protect and use Biodiversity?

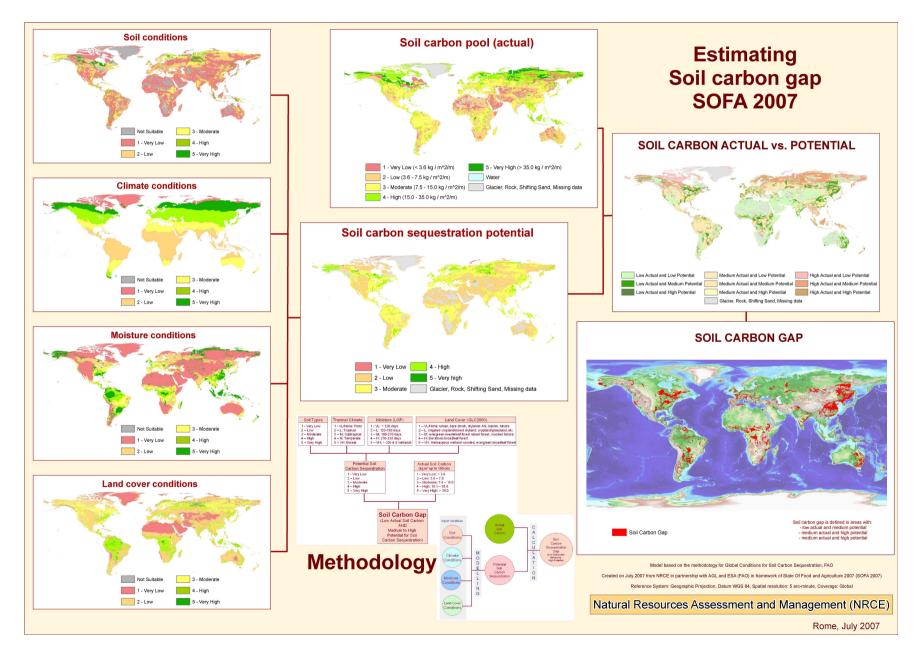

Estimating Soil Carbon Gap methodology

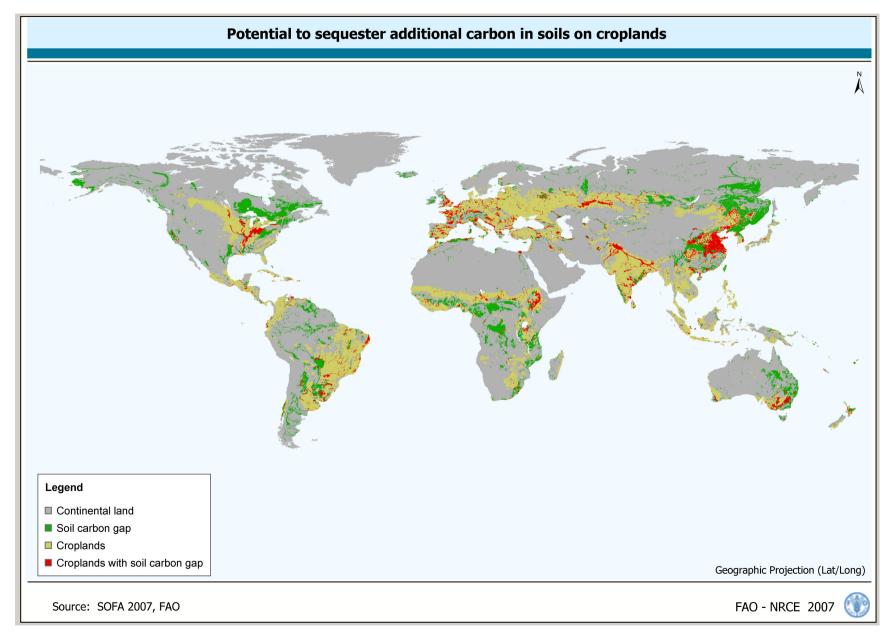

Estimating Soil Carbon gap SOFA 2007

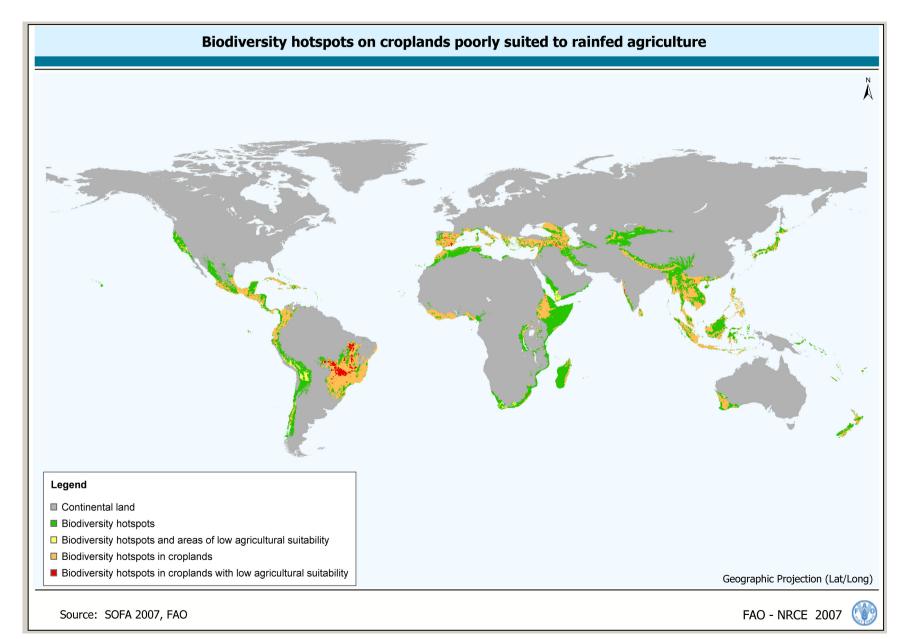

Potential to sequester additional carbon in Soils on croplands

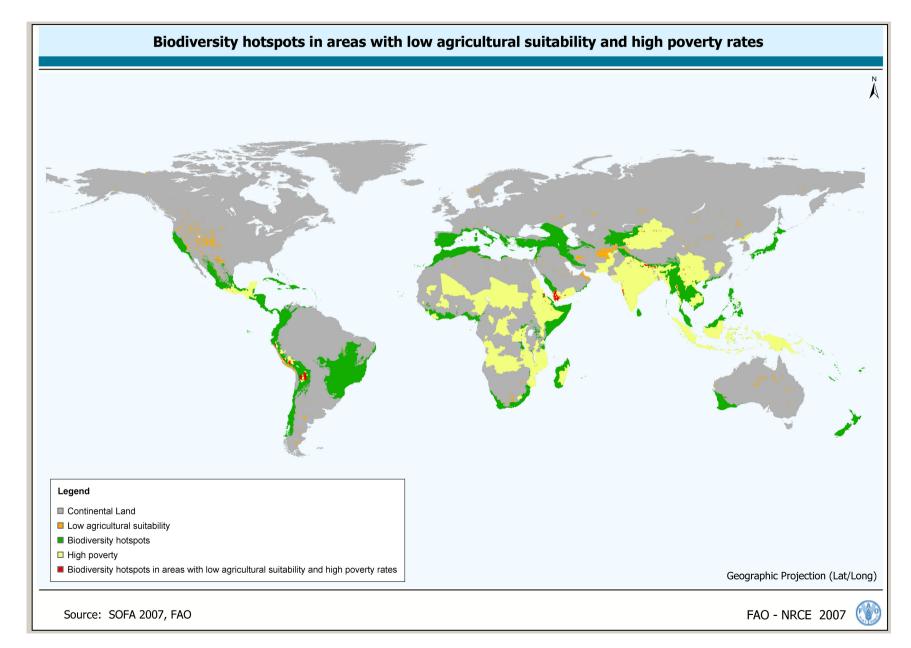

Biodiversity hotspots on croplands poorly Suited to rainfed agriculture

Biodiversity hotspots in areas with low agricultural Suitability and high poverty rates

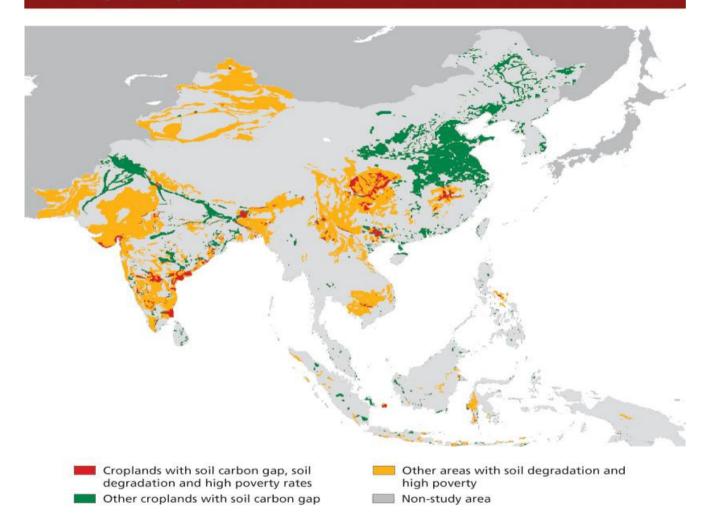

Where could the poor benefit from sequestering soil carbon on croplands?

MAP 8

Highly degraded croplands with soil carbon sequestration potential and high poverty rates

FINAL REMARKS (I)

- Climate change is a major driver of genetic erosion (not only) in agriculture.
- National conservation strategies of genetic resources have still not included climate change in their planning and international cooperation and support.
- Sustainable use strategies of genetic diversity are key to adapt our food production, but they are long-term strategies, investment is required NOW.

FINAL REMARKS (II)

- Strengthening the existing global framework on agricultural genetic resources would be an efficient mechanism to confront climate change in food and agriculture.
- Targeted investments in existing initiatives and policy instruments could generate win-win strategies in climate change adaptation, biodiversity conservation and food security.

FINAL REMARKS (III)

- Sectorial approaches are however not sufficient. Coordination across sectors is needed to identify synergies and trade-offs, and enhance participation in designing successful responses to emerging challenges.
- Innovative inter-sectorial mechanisms of cooperation are needed for tackling new challenges. At international level the Commission's Multi-Year Programme of Work could offer an excellent platform to cooperate with the climate change community.

THANK YOU
